Lecture 2

$B \to K \ell^+ \ell^- \text{ and } \bar{B}_s \to \gamma \ell^+ \ell^- \text{ Decays}$

- 1. Introduction.
- 2. Motivation for introducing the spectral density approach.
- 3. The $\bar{B}_s \rightarrow \gamma \mu^+ \mu^-$ decay rate at large q^2 .
- 4. Towards the evaluation of the charming penguin contributions.
- 5. Other contributions requiring spectral density methods.
- 6. Renormalisation.
- 7. Status of the exploratory numerical calculations of charming penguin contributions.
- 8. Conclusions.

1. Introduction

- searching for signatures of New Physics.
- - The new difficulties arise because the amplitudes are complex.
 - problem.

• Processes mediated by FCNC, which are rare in the SM, are a fruitful area for exploring the limits of the SM and in

• In order to compute the full amplitudes for decays such as $B \to K\ell^+\ell^-$ and $B_s \to \gamma\ell^+\ell^-$ using lattice QCD, in addition to controlling the usual lattice systematic uncertainties (e.g. continuum, finite-volume, heavy-quark mass extrapolations), we must handle the new difficulties present in the Minkowski \rightarrow Euclidean space continuation.

• New methods, based on the spectral density approach, have and are being developed to tackle this

• The methods can be applied, in particular (but not only) to the "charming penguin" contributions.

Introduction (cont.)

- Much of the presentation will be based on:
 - " $B_s \rightarrow \mu^+ \mu^- \gamma$ decay rates at large q^2 from lattice QCD",
 - including contributions from "Charming Penguins",

which in turn are based on papers including:

- HLT "Extraction of spectral densities from lattice correlators",
- SFR "Spectral function determination of complex electroweak amplitudes with lattice QCD", **SFR** = Spectral Function Reconstruction.

I warmly thank my collaborators from whom I learned much of the material presented in this talk.

The Effective $b \rightarrow s$ Hamiltonian

$$\mathscr{H}_{\text{eff}}^{b \to s} = 2\sqrt{2}G_F V_{tb} V_{ts}^* \left[\sum_{i=1,2}^{2} C_i O_i^c + \sum_{i=3}^{6} C_i O_i + \frac{\alpha_{\text{em}}}{4\pi} \sum_{i=7}^{10} C_i O_i \right]$$

$$O_1^c = (\bar{s}_i \gamma^\mu P_L c_j) \ (\bar{c}_j \gamma_\mu P_L b_i) \qquad O_2^c = (\bar{s}_i \gamma_\mu P_L b_i)$$

 O_{3-6} are QCD Penguins with small Wilson Coefficients

$$O_7 = -\frac{m_b}{e} \left(\bar{s} \sigma^{\mu\nu} F_{\mu\nu} P_R b \right) \qquad O_8 = -\frac{g_s m_b}{4\pi \alpha_{\rm em}} \left(\bar{s} \sigma^{\mu\nu} G_{\mu\nu} P_R b \right)$$

$$O_{9} = (\bar{s} \gamma^{\mu} P_{L} b) \ (\bar{\mu} \gamma_{\mu} \mu) \qquad \qquad O_{10} = (\bar{s} \gamma^{\mu} P_{L} b) \ (\bar{\mu} \gamma_{\mu} \gamma^{5} \mu)$$

The amplitude is given by: $\mathscr{A} = \langle \gamma(k,\epsilon) \, \mu^+ \langle \eta(k,\epsilon) \, \mu^+ \rangle \, dk = \langle \eta(k,\epsilon) \, \mu^+ \langle \eta(k,\epsilon) \, \mu^+ \rangle \, dk = \langle \eta(k,\epsilon) \, \mu^+$ $= -e \frac{\alpha_{\rm em}}{\sqrt{2\pi}} V_{tb} V_{ts}^* \epsilon_{\mu}^* \left[\sum_{i=1}^9 C_i H_i^{\mu\nu} L_{V\nu} + C_{10} \left(H_{10}^{\mu\nu} \right) \right]$

 $(\bar{s} \gamma^{\mu} P_L c) (\bar{c} \gamma_{\mu} P_L b)$

$$\left(P_{L,R} = \frac{1}{2}\left(1 \mp \gamma^5\right)\right)$$

 $F_{\mu\nu}$ and $G_{\mu\nu}$ are the QED and QCD Field Strength Tensors

$$\begin{array}{l} (p_1) \,\mu^-(p_2) \mid - \,\mathscr{H}_{\text{eff}}^{b \to s} \mid B_s(p) \,\rangle_{\text{QCD+QED}} \\ \\ \mu\nu \,L_{A\,\nu} - \,i \frac{f_{B_s}}{2} \,L_A^{\mu\nu} p_\nu \Big) \end{array}$$
The $H_{A\,\nu}$

 $I^{\mu\nu}$ and L are hadronic and leptonic tensors respectively

2. Motivation for introducing the spectral density

• For illustration, consider the contribution from the operators $O_1^{(c)}$ and $O_2^{(c)}$ in the $B \to K\ell^+\ell^-$ decay.

$$H^{\mu}(q) = i \int d^4x \, e^{iq \cdot x} < K(\vec{p}_K) |T[J^{\mu}_{\text{em}}(x) \, O^{(c)}_{1,2}(0)] |B(\vec{0}|) \ge i \int_{-\infty}^{\infty} dt \, e^{iq_0 t} < K(\vec{p}_K) |T[\tilde{J}^{\mu}_{\text{em}}(t, \vec{q}) \, O^{(c)}_{1,2}(0)] |B(\vec{0}|) \ge i \int_{-\infty}^{\infty} dt \, e^{iq_0 t} < K(\vec{p}_K) |T[\tilde{J}^{\mu}_{\text{em}}(t, \vec{q}) \, O^{(c)}_{1,2}(0)] |B(\vec{0}|) \ge i \int_{-\infty}^{\infty} dt \, e^{iq_0 t} < K(\vec{p}_K) |T[\tilde{J}^{\mu}_{\text{em}}(t, \vec{q}) \, O^{(c)}_{1,2}(0)] |B(\vec{0}|) \ge i \int_{-\infty}^{\infty} dt \, e^{iq_0 t} < K(\vec{p}_K) |T[\tilde{J}^{\mu}_{\text{em}}(t, \vec{q}) \, O^{(c)}_{1,2}(0)] |B(\vec{0}|) \ge i \int_{-\infty}^{\infty} dt \, e^{iq_0 t} < K(\vec{p}_K) |T[\tilde{J}^{\mu}_{\text{em}}(t, \vec{q}) \, O^{(c)}_{1,2}(0)] |B(\vec{0}|) \ge i \int_{-\infty}^{\infty} dt \, e^{iq_0 t} < K(\vec{p}_K) |T[\tilde{J}^{\mu}_{\text{em}}(t, \vec{q}) \, O^{(c)}_{1,2}(0)] |B(\vec{0}|) \ge i \int_{-\infty}^{\infty} dt \, e^{iq_0 t} < K(\vec{p}_K) |T[\tilde{J}^{\mu}_{\text{em}}(t, \vec{q}) \, O^{(c)}_{1,2}(0)] |B(\vec{0}|) \ge i \int_{-\infty}^{\infty} dt \, e^{iq_0 t} < K(\vec{p}_K) |T[\tilde{J}^{\mu}_{\text{em}}(t, \vec{q}) \, O^{(c)}_{1,2}(0)] |B(\vec{0}|) \ge i \int_{-\infty}^{\infty} dt \, e^{iq_0 t} < K(\vec{p}_K) |T[\tilde{J}^{\mu}_{\text{em}}(t, \vec{q}) \, O^{(c)}_{1,2}(0)] |B(\vec{0}|) \ge i \int_{-\infty}^{\infty} dt \, e^{iq_0 t} < K(\vec{p}_K) |T[\tilde{J}^{\mu}_{\text{em}}(t, \vec{q}) \, O^{(c)}_{1,2}(0)] |B(\vec{0}|) \ge i \int_{-\infty}^{\infty} dt \, e^{iq_0 t} < K(\vec{p}_K) |T[\tilde{J}^{\mu}_{\text{em}}(t, \vec{q}) \, O^{(c)}_{1,2}(0)] |B(\vec{0}|) \ge i \int_{-\infty}^{\infty} dt \, e^{iq_0 t} < K(\vec{p}_K) |T[\tilde{J}^{\mu}_{\text{em}}(t, \vec{q}) \, O^{(c)}_{1,2}(0)] |D(\vec{0}|) \ge i \int_{-\infty}^{\infty} dt \, e^{iq_0 t} < K(\vec{p}_K) |T[\tilde{J}^{\mu}_{\text{em}}(t, \vec{q}) \, O^{(c)}_{1,2}(0)] |D(\vec{0}|) \ge i \int_{-\infty}^{\infty} dt \, e^{iq_0 t} < K(\vec{p}_K) |T[\tilde{J}^{\mu}_{1,2}(t, \vec{q}) \, O^{(c)}_{1,2}(t, \vec{q})] |T[\tilde{J}^{\mu}_{1,2}(t, \vec{q}) |T[\tilde{J}^{\mu}_{1,2}(t, \vec{q})] |T[\tilde{J}^{\mu}_{1,2}(t, \vec{q})] |T[\tilde{J}^{\mu}_{1,2}(t, \vec{q}) |T[\tilde{J}^{\mu}_{1,2}(t, \vec{q})] |T[\tilde{J}^{\mu}_{1,2}(t, \vec{q}$$

- energies $> m_B$ and this contribution is real. (Diagram (a))
- $\vec{0}$ and therefore can have energies $< m_R$ and therefore a complex contribution. (Diagram (b))

 $(O_{1,2}^{(c)})$ implies either of the two current-current operators.)

• For t < 0, the states propagating between t and 0, have B = 1 and three momentum $-\vec{q}$. They therefore have

• For t > 0 on the other hand, the states propagating between 0 and t have B = 0 (and S = 1) and three momentum

>

Motivation for introducing the spectral density (cont)

• For t > 0, the correlation function is given by

$$C^{\mu}_{(b)}(t,\vec{q}\,) \equiv \int d^3x \, e^{-i\vec{q}\cdot\vec{x}} \, < K(-\vec{q}\,) |J^{\mu}_{\rm em}(t,\vec{x}\,) \, O^{(c)}_{1,2}(0)|B(\vec{0}\,) > \\ = \int \frac{dE}{2\pi} \, e^{-i(E-E_K)t} \, \rho^{\mu}_{(b)}(E,\vec{q}\,) \, dE_{(b)}(E,\vec{q}\,) \, dE_{(b)}(E,\vec{q}\,) \, dE_{(b)}(E,\vec{q}\,) = \int \frac{dE}{2\pi} \, e^{-i(E-E_K)t} \, \rho^{\mu}_{(b)}(E,\vec{q}\,) \, dE_{(b)}(E,\vec{q}\,) \, dE_{(b)}(E,\vec{q}\,)$$

where

$$\rho^{\mu}_{(b)}(E,\vec{q}\,) = \langle K(-\vec{q}\,)|J^{\mu}_{\rm em}(0)\,(2\pi)^3\delta^{(3)}(\hat{\mathbf{P}})\,(2\pi)\delta(\hat{H}-E)\,O^{(c)}_{1,2}(0)|B(\vec{0}\,)\rangle$$

- iii) the correlation function can be computed in Euclidean space.

• Good news: i) the spectral density $\rho_{(b)}^{\mu}$ is independent of t and is the same in Minkowski and Euclidean space; ii) the expression for the correlation function in Euclidean space is the same as above with $e^{-i(E-E_K)t} \rightarrow e^{-(E-E_K)t}$;

• Less good news: The inverse problem of determining the spectral density from the Laplace transform is delicate.

Motivation for introducing the spectral density (cont.)

• The hadronic factor in the amplitude from time ordering (b) is:

$$H^{\mu}_{(b)}(q) = i \int_{0}^{\infty} dt \ e^{iq_{0}t} \ C^{\mu}_{(b)}(t,\vec{q}\,) = i \int_{0}^{\infty} dt \ \int \frac{dE}{2\pi} \ e^{-i(E-E_{K}-q_{0})t} \rho^{\mu}_{(b)}(t,\vec{q}\,) = \lim_{\epsilon \to 0} \int_{E^{*}}^{\infty} \frac{dE}{2\pi} \ \frac{\rho^{\mu}_{(b)}(t,\vec{q}\,)}{E-m_{B}-i\epsilon} \\ (E^{*} < m_{B} \text{ is the threshold})$$

• The HLT method is based on the expansion of the "smearing kernel" in terms of exponentials at finite ϵ :

$$\frac{1}{E - m_B - i\epsilon} \simeq \sum_{n=1}^N g_n(m_B, \epsilon) e^{-anE} \qquad \text{so that}$$

$$H^{\mu}_{(b)}(q) = \lim_{\epsilon \to 0} \sum_{n=1}^N g_n(m_B, \epsilon) \int_{E^*}^\infty \frac{dE}{2\pi} e^{-aEn} \rho^{\mu}_{(b)}(E, \vec{q}\,) = \lim_{\epsilon \to 0} \sum_{n=1}^N g_n(m_B, \epsilon) e^{-aE_K n} C^{\mu}_{(b), \text{Eucl}}(an, \vec{q}\,)$$

be obtained.

• In principle at least, the $g_n(m_B, \epsilon)$ can be determined and the $C_{(b), \text{Eucl}}(an, \overrightarrow{q})$ can be computed so that $H^{\mu}_{(b)}(q)$ can Significant practical issues remain.

3. The $B_s \rightarrow \mu^+ \mu^- \gamma$ Decay Rate at Large q^2

R.Frezzotti, G.Gagliardi, V.Lubicz, G.Martinelli, CTS, F.Sanfilippo, S.Simula, N.Tantalo, arXiv:2402.03262

- density approach and to highlight those which require HLT/SFR.
- penguin contributions is significant.

• We use this interesting FCNC process to illustrate the elements which we are able to compute without the spectral

• Preview: The decay rate is dominated by the local form factor F_V , but the error estimated from the charming

$$\frac{2}{B_s}(1-x_{\gamma}), \qquad 0 \le x_{\gamma} \le 1 - \frac{4m_{\mu}^2}{m_{B_s}^2}$$

• LHCb: $B(B_s \to \mu^+ \mu^- \gamma) |_{\sqrt{q^2} > 4.9 \,\text{GeV}} < 2.0 \times 10^{-9}$, arXiv:2108.09283/4

From the May/June 2024 issue of the Cern Courier

11100 LHCb targets rare radiative decay

Rare radiative b-hadron decays are powerful probes of the Standard Model (SM) sensitive to small deviations caused by potential new physics in virtual loops. One such process is the decay of $B_s^{\circ} \rightarrow \mu^+ \mu^$ γ. The dimuon decay of the B^o_s meson is known to be extremely rare and has been measured with unprecedented precision by LHCb and CMS. While performing this measurement, LHCb also studied the $B_s^0 \rightarrow \mu^+ \mu^- \gamma$ decay, partially reconstructed due to the missing photon, as a background component of the $B_s^{\circ} \rightarrow \mu^+\mu^$ process and set the first upper limit on its branching fraction to 2.0 × 10⁻⁹ at 95% CL (red arrow in figure 1). However, this search was limited to the high-dimuonmass region, whereas several theoretical extensions of the SM could manifest

Fig. 1. 95% confidence limits on differential branching fractions for $B_s^\circ \rightarrow \mu^+ \mu^- \gamma$ in intervals of dimuon mass squared (q²). The shaded boxes illustrate SM predictions for the process,

themselves in lower regions of the dimuon-mass spectrum. Reconstructing the photon is therefore essential to explore the spectrum thoroughly and probe a wide range of physics scenarios.

The LHCb collaboration now reports the first search for the $B_s^0 \rightarrow \mu^+ \mu^- \gamma$ decay with a reconstructed photon, exploring the full dimuon mass spectrum. Photon reconstruction poses additional experimental challenges, such as degrading the mass resolution of the B^o_s candidate and introducing additional background contributions. To cope with this ambitious search, machine-learning algorithms and new variables have been specifically designed with the aim of discriminating the signal among background processes with similar signatures. The analysis ▷

$$\mathscr{H}_{\text{eff}}^{b \to s} = 2\sqrt{2}G_F V_{tb}V_{ts}^* \left[\sum_{i=1,2}^{2} C_i O_i^c + \sum_{i=3}^{6} C_i O_i + \frac{\alpha_{\text{em}}}{4\pi} \sum_{i=7}^{10} C_i O_i \right]$$

 $O_2^c = (\bar{s} \gamma^{\mu} P_L c) (\bar{c} \gamma_{\mu} P_L b)$ $O_1^c = (\bar{s}_i \gamma^{\mu} P_L c_j) (\bar{c}_j \gamma_{\mu} P_L b_i)$

 O_{3-6} are QCD Penguins with small Wilson Coefficients

$$O_7 = -\frac{m_b}{e} \left(\bar{s} \sigma^{\mu\nu} F_{\mu\nu} P_R b \right) \qquad O_8 = -\frac{g_s m_b}{4\pi \alpha_{\rm em}} \left(\bar{s} \sigma^{\mu\nu} G_{\mu\nu} P_R b \right)$$

$$O_9 = (\bar{s} \gamma^{\mu} P_L b) (\bar{\mu} \gamma_{\mu} \mu)$$
 $O_{10} = ($

The amplitude is given by: $\mathscr{A} = \langle \gamma(k,\epsilon) \mu^+ \rangle$ $= -e \frac{\alpha_{\rm em}}{\sqrt{2\pi}} V_{tb} V_{ts}^* \epsilon_{\mu}^* \bigg[\sum_{i=1}^9 C_i H_i^{\mu\nu} L_{V\nu} + C_{10} \Big(H_{10}^{\mu\nu} \Big) \bigg]$

Reminder of the Effective $b \rightarrow s$ Hamiltonian

$$\left(P_{L,R} = \frac{1}{2}\left(1 \mp \gamma^5\right)\right)$$

 $F_{\mu\nu}$ and $G_{\mu\nu}$ are the QED and QCD Field Strength Tensors

 $(\bar{s} \gamma^{\mu} P_L b) (\bar{\mu} \gamma_{\mu} \gamma^5 \mu)$

$$(p_{1}) \mu^{-}(p_{2}) | - \mathscr{H}_{\text{eff}}^{b \to s} | B_{s}(p) \rangle_{\text{QCD+QED}}$$

$$\overset{\mu\nu}{}_{10} L_{A\nu} - i \frac{f_{B_{s}}}{2} L_{A}^{\mu\nu} p_{\nu} \Big)$$
The $H_{A\nu}^{\mu\nu}$

 $^{\mu\nu}$ and L are hadronic and leptonic tensors respectively

$$H_{9}^{\mu\nu}(p.k) = H_{10}^{\mu\nu}(p.k) = i \int d^{\mu\nu} dx$$

=-i(g

- These form factors can be computed from Euclidean correlation functions (at accessible values of m_b).
- We choose $\mathbf{p} = \mathbf{0}$ and $\mathbf{k} = (0, 0, k_z)$ and use twisted boundary conditions for k_z .
- With such a choice of kinematics:

$$\frac{1}{2k_z} \left(H_V^{12}(p,k) - H_V^{21}(p,k) \right) \to F_V(x_\gamma) \text{ and } \frac{i}{2E_\gamma} \left(H_A^{11}(p,k) + H_A^{22}(p,k) \right) \to F_A$$

Contribution from "Semileptonic" Operators - F_V and F_A

 $d^4 y \langle 0 | T [\bar{s} \gamma^{\nu} P_L b(0) J^{\mu}_{em}(y)] | \bar{B}_s(p) \rangle$

$$g^{\mu\nu}(k \cdot q) - q^{\mu}k^{\nu}) \frac{F_A(q^2)}{2m_{B_s}} + \epsilon^{\mu\nu\rho\sigma}k_{\rho}q_{\sigma}\frac{F_V(q^2)}{2m_{B_s}}$$

• In a similar way the following contributions can be computed:

- Here, for now, we are isolating the contribution in which it is the virtual photon which is emitted from O_7 .
- With our choice of kinematics:

$$\frac{1}{2k_z} \left(H_{TV}^{12}(p,k) - H_{TV}^{21}(p,k) \right) \to F_{TV}(x_\gamma) \text{ and } \frac{-i}{2E_\gamma} \left(H_A^{11}(p,k) + H_A^{22}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) + H_A^{22}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{21}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{21}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{21}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{21}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{21}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{21}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{21}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{21}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{21}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{21}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{21}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{21}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{21}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{21}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{21}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{21}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{21}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{21}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{21}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{21}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{21}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{11}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{21}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{11}(p,k) \right) \to F_{TA}(p,k) + \frac{1}{2k_z} \left(H_A^{11}(p,k) - H_A^{11}(p,k) \right)$$

• There is also the useful kinematical constraint that $F_{TV}(1) = F_{TA}(1)$.

The form factors F_{TV} and F_{TA}

$$(-q^{\mu}k^{\nu})\frac{m_b F_{TA}(q^2)}{q^2} + \epsilon^{\mu\nu\rho\sigma}k_\rho q_\sigma \frac{m_b F_{TV}(q^2)}{q^2}$$

Numerical Results for F_V , F_A , F_{TV} , F_{TA}

- These four form-factors can be computed using "standard" methods at the available heavy quark masses.
- We use gauge field configurations generated by the European Twisted Mass Collaboration (ETMC), with ensemble with 0.057 fm < a < 0.091 fm).
- We perform the calculations at 5 values of the heavy quark mass corresponding to

$$\frac{m_h}{m_c} = 1, 1$$

and at 4 values of $x_{\gamma} = 0.1, 0.2, 0.3, 0.4$.

- m_c is determined from $m_{\eta_c} = 2.984(4)$ GeV.
- Much effort is then devoted to the $m_h \rightarrow m_h$ and $a \rightarrow 0$ limit, guided by the heavy-quark scaling laws and models for possible resonant contributions.

the Iwasaki gluon action and $N_f = 2 + 1 + 1$ flavours of Wilson-Clover light quarks at maximal twist (four

.5, 2, 2.5 and 3.

Continuum Extrapolation

- The continuum extrapolation is performed separately at each value of m_{H_s} and x_{γ} .
- The illustration plots are for $x_{\gamma} = 0.4$.

Extrapolation of the results to $m_{B_c} = 5.367$ GeV

- In the heavy-quark and large E_{γ} limits, scaling laws were derived up to $O(1/m_{H_s}, 1/E_{\gamma})$:

$$\frac{F_{V/A}}{f_{H_s}} = \frac{|q_s|}{x_{\gamma}} \left(\frac{R(E_{\gamma}, \mu)}{\lambda_B(\mu)} + \xi(x_{\gamma}, m_{H_s}) \pm \frac{1}{m_{H_s} x_{\gamma}} \pm \frac{|q_b|}{|q_s|} \frac{1}{m_h} \right) \quad ; \quad \frac{F_{TV/TA}}{f_{H_s}} = \frac{|q_s|}{x_{\gamma}} \left(\frac{R_T(E_{\gamma}, \mu)}{\lambda_B(\mu)} + \xi(x_{\gamma}, m_{H_s}) \pm \frac{1 - x_{\gamma}}{m_{H_s} x_{\gamma}} + \frac{|q_b|}{|q_s|} \frac{1}{m_h} \right)$$

- LCDA, $\xi(x_{\gamma}, m_{H_s})$ are power corrections.
- Photon emission from the *b*-quark suppressed relative to the emission from the *s*-quark.
- Tensor form-factors are presented in the \overline{MS} scheme at $\mu = 5 \text{ GeV}$.
- above scaling laws at large E_{γ} as well as VDM behaviour.

• Having performed the continuum extrapolation, we need to extrapolate the results to the physical value of m_{B_s} .

M.Beneke and J.Rohrwild, arXiv:1110.3228; M. Beneke, C. Bobeth and Y.-M. Wang, arXiv:2008.12494

• $R(E_{\gamma},\mu)$, $R_T(E_{\gamma},\mu)$ are radiative correction factors $= 1 + O(\alpha_s)$; λ_B is the first inverse moment of the B_s -meson

However, useful though these scaling laws are, they apply at large E_{γ} (as well as large m_h), are there are significant corrections at our lightest values of m_h and smaller values of E_{γ} . We therefore us an ansatz which includes the

Extrapolation of the results to $m_{B_s} = 5.367$ GeV

 $x_{\gamma} = 0.1$ \longrightarrow $x_{\gamma} = 0.2$ \longrightarrow $x_{\gamma} = 0.3$ \longrightarrow $x_{\gamma} = 0.4$ \longrightarrow

Comparison with Previous Determinations of the Form Factors

- Ref.[3] = T.Janowski, B.Pullin and R.Zwicky, arXiv:2106.13616, LCSR
- Ref.[4]= A.Kozachuk, D.Melikhov and N.Nikitin, arXiv:1712.07926, relativistic dispersion relations
- Ref.[5]= D.Guadagnoli, C.Normand, S.Simula and L.Vittorio, arXiv:2303.02174, VMD+quark model+lattice at charm

• In general our results for the form factors differ significantly from earlier estimates.

18

Other Contributions - \overline{F}_T

$$H_{\bar{T}}^{\mu\nu}(p,k) = i \int d^4y \ e^{i(p-k)\cdot y} \ \langle 0 | T \Big[J_{\bar{T}}^{\nu}(0) \ J_{\text{em}}^{\mu}(y) \Big] \ |\bar{B}_s(\mathbf{0}) \ \rangle \equiv -\epsilon^{\mu\nu\rho\sigma} k_\rho \ p_\sigma \frac{\bar{F}_T}{m_{b_s}} \text{ where}$$
$$J_{\bar{T}}^{\nu} = -i Z_T(\mu) \ \bar{s}\sigma^{\nu\rho}b \ \frac{k^\rho}{m_{B_s}} .$$

- The difficulty arises from the first diagram above when $t_y > 0$.
- In that case we potentially have a hadronic intermediate state (e.g. an $s\bar{s}$ 1⁻ state) with smaller mass than $(p-k)^2$, leading to an imaginary part and problems with the continuation to Euclidean space.

$$\sqrt{m_V^2 + E_\gamma^2} + E_\gamma < m_{B_s} \implies x_\gamma < 1 - \frac{m_V^2}{m_{B_s}^2} \simeq 1 - \frac{4m_K^2}{m_{B_s}^2} \simeq 0.96 \,.$$

- For t > 0 define C_{t}
- In Euclidean space
- For the amplitude we require: $H^{\mu\nu}_{\bar{T}_s}(m_B,\mathbf{k}) = i \int_0^\infty dt \ e^{i(m_B-\omega)t} C^{\mu\nu}_s(t,\mathbf{k})$

• Expanding
$$\frac{1}{E - E' - i\epsilon} \simeq \sum_{n=1}^{N} g_n(E', \epsilon) e^{-anE}$$
 we obtain
 $H_{\overline{T}_s}^{\mu\nu}(m_B, \mathbf{k}) = \lim_{\epsilon \to 0} \int_{E^*}^{\infty} \frac{dE}{2\pi} \frac{\rho_s^{\mu\nu}(E, \mathbf{k})}{E - (m_B - \omega) - i\epsilon} = \lim_{\epsilon \to 0} \sum_{n=1}^{N} g_n(m_B - \omega, \epsilon) C_s^{\mu\nu}(an, \mathbf{k})$

F_T (cont.)

$$\begin{split} & \mathcal{I}_{s}^{\mu\nu}(t,\mathbf{k}) \equiv \langle 0 \,| \, \tilde{J}_{\text{em},s}^{\mu}(t,-\mathbf{k}) \,J_{\bar{T}}^{\nu}(0) \,| \,B_{s}(\mathbf{0}) \rangle \ = \int_{E^{*}}^{\infty} \frac{dE}{2\pi} \,e^{-iEt} \,\rho_{s}^{\mu\nu}(E,\mathbf{k}) \,dE \\ & \mathcal{I}_{s}^{\mu\nu}(t,\mathbf{k}) = \int_{E^{*}}^{\infty} \frac{dE}{2\pi} \,e^{-Et} \,\rho_{s}^{\mu\nu}(E,\mathbf{k}) \,. \end{split}$$

$$\mathbf{x} = \lim_{\epsilon \to 0} \int_{E^*}^{\infty} \frac{dE}{2\pi} \frac{\rho_s^{\mu\nu}(E, \mathbf{k})}{E - (m_B - \omega) - i\epsilon} \cdot (\omega = |\mathbf{k}|)$$

• Now we need to see how well we can make this work.

- in the correlation functions $C_{s}(an, \mathbf{k})$.
- gauge-field ensembles (a = 0.0796(1) fm and 0.0569(1) fm).

i) \bar{F}_T only gives a very small contribution to the rate and is therefore not needed with great precision. ii) The spectral density method is computationally expensive.

- An extrapolation in ϵ is required, as well as those in a and m_h .

F_T (cont.)

• Determining the g_n requires a balance between the systematic error due to the approximation of $1/(E - E' - i\epsilon)$ by a finite number of exponentials (in which the coefficients are generally large with alternating signs) and the statistical errors

• We have computed \bar{F}_T at all four values of x_{γ} , at three of the five values of m_h ($m_h/m_c = 1, 1.5, 2.5$) and on two of the

• Resulting error is O(100%) but $\bar{F}_T \ll F_{TV}$, F_{TA} . No clear x_{γ} dependence is observed in our data and we quote: Re $\bar{F}_T^s(x_{\gamma}) = -0.019(19)$ and Im $\bar{F}_T^s(x_{\gamma}) = 0.018(18)$.

Other Contributions - Charming Penguins

- Of the contributions we have not computed directly, the most significant one at large q^2 is expected to be that from the operators $O_{1,2}^c$ (charming penguins) and we are aiming to use the spectral density reconstruction method to overcome this.
- In the meantime we followed previous ideas and estimate the contribution based on VMD inserting all $c\bar{c}$ resonances from the J/Ψ to the $\Psi(4660)$. It can be viewed as a shift in $C_9 \rightarrow C_9^{\text{eff}}(q^2) = C_9 + \Delta C_9(q^2)$:

$$\Delta C_9(q^2) = -\frac{9\pi}{\alpha_{\rm em}^2} \left(C_1 + \frac{C_2}{3} \right) \sum_V |k_V| e^{i\delta_V} \frac{m_V \Gamma_V B(V \to \mu^+ \mu^-)}{q^2 - m_V^2 + im_V \Gamma_V}$$

to vary over $(0,2\pi)$ and $|k_V|$ to vary in the range 1.75 ± 0.75 .

• k_V and δ_V parametrise the deviation from the factorisation approximation (in which $\delta_V = k_V - 1 = 0$). We allow δ_V

23

Branching Fractions

- Structure Dependent (SD) contribution dominated by F_V .
- The error from the charming penguins increases with x_{γ} (at $x_{\gamma} = 0.4$ it is about 30 %).
- Our Result $\mathscr{B}_{SD}(0.166) = 6.9(9) \times 10^{-11}$; LHCb $\mathscr{B}_{SD}(0.166) < 2 \times 10^{-9}$.

4. Towards the evaluation of the charming penguin contributions

progress).

• As explained above, the new spectral density reconstruction techniques, described earlier in this talk, give us the opportunity to evaluate the charming penguin contributions to $B \to K\ell^+\ell^-$ and $\bar{B}_s \to \gamma \mu^+ \mu^-$ decays (work in

Evaluating the charming penguin contributions (cont.)

• For $B \to \gamma \ell^+ \ell^-$ decays, with the *B*-meson at rest, the hadronic factor in the amplitude is

$$H_{1,2}^{\mu\nu}(\vec{k}\,) = i \,\int dt \int d^3x \,\int dt_W \,\int d^3y \,\left\langle 0 | T \left[J^{\mu}_{\gamma}(t,\vec{x}\,) \,J^{\nu}_{\gamma^*}(0,\vec{y}\,) \,O^{(c)}_{1,2}(t_W,\vec{0}\,) \right] | \bar{B}_s(\vec{0}\,) \right\rangle e^{ik\cdot x} \, e^{i\vec{k}\cdot\vec{y}} \,,$$

where the subscripts γ and γ^* indicate the currents at which the real and virtual photons are emitted.

- density methods.
- In (a), $t_W < 0 < t$, on-shell states with energies $E < m_R$ can propagate between t_W and 0.
- In (b), $t_W < t < 0$, on-shell states with energies $E_1 < m_B$ can propagate between t_W and t. In addition however, have a double pole:

• There are now three operators and so 6 possible time-orderings. The three above are the ones requiring spectral

depending on the value of q, on-shell states with energies $E_2 < q^0$ can propagate between t and 0. In this case we

• In (c), $t < t_W < 0$, depending on the value of q, on-shell states with energies $E < q^0$ can propagate between t_W and 0.

Evaluating the charming penguin contributions (cont.)

 $\bar{B}_s(\vec{0}) \longrightarrow O_{1,2}^{(c)}(t_W)$

• For $\bar{B}_s \to \gamma \ell^+ \ell^-$ decays, from diagram (b) we can have a double pole:

$$H_{(b)}^{\mu\nu}(\vec{k}\,) = -\int_{E_1^*}^{\infty} \frac{dE_1}{2\pi} \int_{E_2^*}^{\infty} \frac{dE_2}{2\pi} \frac{\rho_2^{\mu\nu}(E_1, E_2, \vec{k}\,)}{(E_1 - m_{\bar{B}_s} - i\epsilon) (E_2 + k_0 - m_{\bar{B}_s} - i\epsilon)}$$

- Both factors in the denominator to be expanded in terms of exponentials.
- denominator.
 - The E_i , $i = 1, \dots, (n 1)$, are integration variables over the spectral region of energies of channel *i*.
 - The E'_i , are the energies in the i^{th} channel if energy were conserved at each vertex.
 - As seen previously, not all poles lie in the region of integration, so the corresponding *ie* can be dropped (in principle at least)

$$B = 0 \qquad B = 0$$

$$\tilde{J}^{\mu}_{\gamma}(t, \vec{k}) \qquad \tilde{J}^{\nu}_{\gamma^{*}}(0, \vec{q})$$

(b)

• In the forthcoming paper, we show that in general matrix elements of non-local operators, consisting of n local operators, can be written as a sum of n! spectral integrals each with n - 1 factors of the form $E_i - E'_i - i\epsilon$ in the

5. Other contributions requiring spectral density methods

spectral density approach.

• We have already seen that the form factor \bar{F}_T contributing to the $\bar{B}_s \to \gamma \ell^+ \ell^-$ decay amplitude required the $B(\vec{0}) \longrightarrow \bigcirc$ $\tilde{J}^{\mu}_{\mathrm{em}}(t,\vec{q}\,)$ $ilde{O}_7(0, \vec{k})$

charming penguin operators $O_{1,2}^{(c)}$ can be repeated for the chromomagnetic operator O_8 . For example:

$$B = 0, S = 1$$

$$B(\vec{0}) \longrightarrow K(\vec{p}_{K})$$

$$\tilde{J}_{em}^{(c)}(t, \vec{q})$$
(b)

and similarly for $\bar{B}_s \to \gamma \ell^+ \ell^-$ decays.

- Similarly for the QCD penguins $O_3 O_6$ when they are eventually included.
- In general which time orderings require the spectral density approach has to be determined by inspection.

Although the diagrams are different (e.g. there is no connected charm-quark loop), the above discussion of the

- - which power UV divergences are not present.
 - Non-perturbative, regularisation independent, schemes exist, which can be used (and which are being widely used) in lattice QCD computations (e.g. RI-Mom, RI-SMom, Schrödinger functional). They then require perturbative matching to the \overline{MS} scheme to correspond to the known Wilson coefficients.
 - - •
 - The divergences, and hence the subtraction procedures, are scheme dependent.
 - Fermions being used in the numerical calculations.

• Renormalisation of the operators is necessary, but highly non-trivial, for the numerical evaluation of the decay amplitudes. • The Wilson coefficients are generally computed perturbatively in the MS scheme, which is purely perturbative and in

• A much more significant problem, is the subtraction of the power divergences, which are present in non-perturbative schemes due to the mixing of the dimension 6-operators $O_{1,2}^{(c)}$ with operators of lower dimension, e.g. $\bar{s}\gamma^5 b$ or $\bar{s}b$. Such divergences appear as inverse powers of the lattice spacing, $1/a^3$, $1/a^2$, 1/a, and must be subtracted non-perturbatively.

• In the forthcoming paper we show that the subtractions can be performed for the Twisted Mass formulation of Lattice

Renormalisation - Contact Terms

- Wilson coefficients.
- However, as we have seen, using SFR we treat the two time orderings separately, and in each case the UV contributions are summed, as required by electromagnetic current conservation.
- In the forthcoming paper we show how to separate the renormalisation of UV divergences (including the cancelation of the power divergences), from the terms which require the SFR/HLT approach.
- Although the details of the separation are process dependent, the approach we follow can be generalised.

• When evaluating matrix elements there may be additional UV divergence when two local operators approach each other - contact terms.

An example is provided by diagram (a) which contains a logarithmic divergence renormalised by subtracting the matrix elements of O_7 and O_9 with suitable

divergence is quadratic as given by dimensional power counting. The quadratic divergences cancel when the two

Separation of Short and Long Distance Contributions

subtractions using, for example:

$$\frac{1}{E - m_B - i\epsilon} = \frac{1}{E + 2m_B - i\epsilon} + \frac{3}{E - i\epsilon} - \frac{3}{E + m_B - i\epsilon} + \frac{6m_B^3}{(E - m_B - i\epsilon)(E - i\epsilon)(E + m_B - i\epsilon)(E + 2m_B - i\epsilon)}$$
UV-divergent - No poles in *E* integration

Spectral Density Techniques

Stanuaru Michious

$$\int_{0}^{\infty} dt \, e^{iq_{0}t} \int d^{3}x \, e^{-i\vec{q}\cdot\vec{x}} \langle K(-\vec{q}) | J_{\rm em}^{\nu}(t,\vec{x}) \, O_{1,2}^{(c)}(0) | B$$

$$\stackrel{\infty}{\underset{+}{}^{*}} \frac{dE}{2\pi} \, \frac{\rho_{1,2}^{\nu+}(E,\vec{q})}{E-m_{B}-i\epsilon}$$

• $\rho_{1,2}^{\nu+}(E, \overrightarrow{q}) \sim E^2$ at large *E* and the energy integral is quadratically divergent. (The quadratic divergence cancel when combined with the contribution from t < 0.) • In order to separate the UV divergences from the treatment of the singularity at $E - m_B - i\epsilon = 0$ we perform

7. Exploratory Numerical Calculation

- to $m_h = m_h$.

• Presence of charmonium resonances \Rightarrow in order to have a smooth extrapolation, we imagine taking the double limit:

$$H_{1,2}^{\nu+;3\text{subs}}(\overrightarrow{q},\epsilon) = \lim_{m \to m_B} \lim_{m_H \to m_B} H_{1,2}^{\nu+;3\text{subs}}(\overrightarrow{q},\epsilon;m_H,m) \quad \text{where}$$
$$\rho^{\nu+}(E,\overrightarrow{q};m_H) \left\{ \frac{1}{E-m-i\epsilon} + \frac{3}{E+m-i\epsilon} - \frac{3}{E-i\epsilon} - \frac{3}{E+2m-i\epsilon} \right\}$$

$$H_{1,2}^{\nu+;3\mathrm{subs}}(\overrightarrow{q},\epsilon) = \lim_{m \to m_B} \lim_{m_H \to m_B} H_{1,2}^{\nu+;3\mathrm{subs}}(\overrightarrow{q},\epsilon;m_H,m) \quad \text{where}$$
$$H_{1,2}^{\nu+;3\mathrm{subs}}(\overrightarrow{q},\epsilon;m_H,m) = \int_{E_+^*}^{\infty} \frac{dE}{2\pi} \rho^{\nu+}(E,\overrightarrow{q};m_H) \left\{ \frac{1}{E-m-i\epsilon} + \frac{3}{E+m-i\epsilon} - \frac{3}{E-i\epsilon} - \frac{3}{E+2m-i\epsilon} \right\}$$

• We have performed an exploratory numerical study of this diagram at a single unphysical value of $m_h = 2m_c$ on a single gauge-field ensemble (a = 0.079 fm) and with $|\overrightarrow{q}| = 250 \,\text{MeV}$..

• For now, we perform the computations at $m_h < m_b$ and extrapolate the results

Sensitive to charmonia, even at $m_H < m_B$

Results for $B_s \to \eta_{ss'} \ell^+ \ell^-$, (preliminary)

 $\Delta = 150 \,\mathrm{MeV}$

• Results are very encouraging and numerous tests are being carried out (extrapolation in ϵ , comparison with VSA, etc.).

Results for $B_s \to K \ell^+ \ell^-$, (preliminary)

8. Conclusions

- For $\bar{B}_s \to \gamma \ell^+ \ell^-$ decays, we have computed the local form factors F_V , F_A , F_{TV} and F_{TA} . The amplitude is dominated by F_V . There are significant discrepancies with earlier estimates obtained using other methods.
- We have also used HLT & SFR to compute the form factor \bar{F}_T . In spite of the O(100%) error, we confirm that it gives a negligible contribution to the amplitude.
- As q^2 is decreased towards the region of charmonium resonances, the uncertainties grow, from 15 % with $\sqrt{q_{\text{cut}}^2} = 4.9 \,\text{GeV}$ to about 30 % for $\sqrt{q_{\text{cut}}^2} = 4.2 \,\text{GeV}$, largely due to the charming penguins for which we have included a phenomenological parametrisation.
- Our priority now is to implement spectral density methods which would allow the evaluation of the charming penguin contributions, as well as those from the operators O_8 , for $B \to K^{(*)}\ell^+\ell^-$ and $\bar{B}_s \to \gamma \ell^+\ell^-$ decays etc.. The theoretical framework has been developed and exploratory numerical work has begun.
- How to manage the various technical issues optimally will take some effort, but we can confidently expect that such amplitudes will be computed with increasing precision in the coming years.
